CHAPTER 1

pymochad

A python library for sending commands to the mochad TCP gateway daemon for the X10 CMA15A controller:

<https://sourceforge.net/projects/mochad/>

Complete documentation is here: <http://pymochad.readthedocs.io/en/latest/>

1.1 Usage

Using PyMochad is pretty straightforward you just need to init a PyMochad object and then issue commands to it. For example:

```
from pymochad import controller  
  
mochad = remote.PyMochad()  
print(mochad.status())
```

will connect to a running mochad instance (running on your localhost) and print the device status.

You can also send a command directly to a device using a device class. For example:

```
from pymochad import controller  
from pymochad import device  
  
mochad = controller.PyMochad()  
light_switch = device.Device(mochad, 'a1')  
light_switch.send_cmd('on')
```

will connect to a running a mochad instance and send the *on* command to the light switch device at address *a1* on the power line interface.

For a complete API documentation see: *PyMochad API*.

CHAPTER 2

PyMochad API

2.1 The PyMochad Controller Class

This is used to interact with the X10 controller directly using the mochad socket

```
class pymochad.controller.PyMochad(server=None, port=1099)
```

Bases: object

PyMochad controller class

This class is used to create a PyMochad controller object that is used to send commands to a running PyMochad daemon.

Parameters

- **server** (*str*) – The host to connect to the pymochad socket on, it defaults to localhost
- **port** (*int*) – The port to use for remote connections. If one is not provided it will just use the default port of 1099.

```
read_data()
```

Read data from mochad

Return data The data returned over the mochad socket

Return type str

```
reconnect()
```

Reconnect when mochad server is restarted/lost connection.

```
send_cmd(cmd)
```

Send a raw command to mochad.

Parameters cmd (*str*) – The command to send to mochad

```
status()
```

Send a show device status command.

Return status The status of device including RF security devices

Return type str

2.2 The PyMochad Device Class

This is used to interact with an X10 device

class pymochad.device.**Device**(*controller*, *address*, *comm_type='pl'*)
Bases: object

PyMochad Device class

This class represents an X1 device connected to your controller

Parameters

- **controller** ([PyMochad](#)) – A PyMochad controller object for the device to use
- **address** (str) – The device address
- **comm_type** (str) – The communication type to use for the device. This is either pl (for power line) or rf (for radio frequency)

get_status()

Get the on/off status for the devices

Returns Device status

Return type str

get_statussec()

Get the on/off status for the X10 Security devices

Returns Device status

Return type str

send_cmd(cmd)

Send a raw command to device.

Parameters cmd (str) – The command to send to the device

Python Module Index

p

`pymochad.controller`, 5
`pymochad.device`, 6

Index

D
